

OpenHouse makes every new home intelligent from the moment it is built.

The intelligence layer installed at construction and useful for the life of the home.

Handover software captures documents. OpenHouse captures the operating context of the home.

OLD CATEGORY

A folder of documents

- PDFs and manuals
- Warranty packs
- Handover folders
- Support tickets

OPENHOUSE

One operating context

- Living home model
- Property assistant
- Image issue intake
- Energy intelligence
- Developer insight

Modern homes are efficient, but they are hard to live in.

New homes and low-carbon systems are better, but most people are not given an operating layer.

Everyday confusion

- Where is the stopcock?
- Can I drill into this wall?
- Is this crack warranty-relevant?

Energy confusion

- Charging an EV at the wrong time
- Misreading heat-pump behaviour
- High bills with no plain answer

The energy transition is moving into the home.

OLD HOME

Bills, boiler, basic heating.

A-RATED NEW BUILD

Heat pump, airtightness, ventilation and higher expectations.

SMART METER HOME

Usage data exists, but context is missing.

GRID-AWARE NETWORK

Homes shift demand, store energy and optimise over time.

Developers hold the source of truth before it disappears.

The best time to make a home intelligent is while it is being built.

01

Build data

Drawings, room dimensions and specifications.

02

Systems

Heat pumps, EV chargers, solar, MVHR and smart meters.

03

Proof

Warranties, manuals, installers and commissioning records.

04

Distribution

The handover moment creates the homeowner relationship.

The assistant homeowners use for everything about the home.

OPENHOUSE

Where is the stopcock?

It is in the utility room, inside the lower cabinet beside the sink.

What paint colour is in the kitchen?

Kitchen walls are Colourtrend Subtle, according to your handover pack.

Day-one utility

- Room sizes, paint colours and finishes
- Stopcock, manuals, warranties and contacts
- Heat pump and MVHR guidance
- Practical answers from verified home context

From photo to next step.

Controlled AI triage

- Classify the issue from the photo
- Check home context and history
- Ask focused follow-up questions
- Assess warranty relevance
- Recommend the next step or route it

Every home gets a living model.

The home model is the asset. The assistant is the interface.

PHYSICAL

Rooms and fabric

Rooms, dimensions, materials, finishes, insulation and build specification.

OPERATIONAL

Devices and warranties

Heat pump, solar, EV charger, MVHR, manuals, installers and maintenance data.

BEHAVIOURAL

Questions and issues

Homeowner questions, preferences, issue history, energy patterns and interventions.

Not a dashboard. A feedback loop between home, homeowner and developer.

Loop

- Diagnose what is happening
- Educate in plain language
- Remember home history
- Intervene when useful
- Escalate when needed

Example

Your bill is higher because the EV charged during the peak window and the heat pump schedule is fighting outdoor temperature. I can suggest a cheaper plan.

Every answer is explained in money, comfort and risk.

Money

What is this costing or saving?

Comfort

How does it affect the lived experience?

Risk

Is this normal, wasteful or a sign of a deeper issue?

From advice to trusted optimisation.

1. ADVISORY

Explain and recommend

Your EV is charging during the peak tariff window.

2. ASSISTED

Ask before action

I can move tonight's EV charge to the cheaper window. Approve?

3. AGENTIC

Optimise within rules

Heat pump, EV, solar, battery, hot water and tariffs, only with consent and override.

Control only happens with consent, rules and override.

Better handover and lower aftercare friction.

86%

Illustrative completion of guided handover tasks.

Why developers care

- Fewer avoidable aftercare tickets
- Better buyer education
- Structured issue intake
- Recurring misunderstanding patterns
- Portfolio insight, not household surveillance

Low-friction deployment. Recurring intelligence revenue.

Layer	Price
Developer provisioning	€99/home
Homeowner subscription	€9.99/month
Future agentic tier	€19.99-€29.99/month
Later network revenue	Developer analytics, housing associations, utility partners

Business model line

€99/home gets OpenHouse installed. Recurring intelligence captures the long-term value.

Homeowners keep control. Developers get portfolio insight.

HOMEOWNER CONTROLS

- Personal data
- Energy usage
- Preferences
- Device permissions

DEVELOPER SUPPLIES

- Build data
- Specifications
- Warranties
- Commissioning records

OPENHOUSE OWNS

- Software
- Model format
- Diagnostics
- Anonymised benchmarks

Ireland proves the model. The UK scales it.

IRELAND

Proof market

Developer-provisioned new builds, real schemes, product proof and tighter founder access.

UK

Scale market

Larger developer base, housing associations, smart-meter scale and stronger energy-pressure market.

NETWORK

Platform upside

Retrofit homes, subscriptions, device integrations, aggregate benchmarks and estate optimisation.

Built by someone inside the problem.

Sam is building from direct exposure to property development, homeowner support, premium product expectations and AI-native execution.

Founder-market fit

- Property development exposure
- Developer workflow understanding
- AI-native build speed
- Premium product taste
- Live OpenHouse product

Why NDRC now

- Capital to accelerate proof
- Mentor pressure and founder network
- Investor readiness
- Market access and credibility
- Clear 12-week goals

We are applying to NDRC to prove construction-stage home intelligence can become the operating layer for modern homes.

PRODUCT

Living home model v1, property assistant, image issue intake and energy intelligence MVP.

PILOTS

Developer deployments, homeowner activation and subscription willingness.

PROOF

Repeatable onboarding, data ownership, UK readiness and investor-grade case studies.

OpenHouse makes the modern home understandable first, and optimisable next.

Energy tools monitor. OpenHouse understands.

Category	What they see	What they miss
Smart meters	Usage	Home context and action
Solar portals	Generation	Whole-home behaviour
Smart home dashboards	Devices	Developer data and education
Aftercare portals	Issues	Energy diagnosis and living model
Generic AI	Conversation	Verified source-of-truth home context

The first proof points are operational, not vanity metrics.

DEVELOPER PROOF

- Homes contracted
- Willingness to pay
- Time to create a home model
- Developer testimonial

HOMEOWNER PROOF

- Activation rate
- Questions per home
- Image uploads
- Answer usefulness

ENERGY PROOF

- Bill interpretation
- EV charge timing
- Heat pump guidance
- Comfort explanations
